

Why is your WordPress site slow?

5 problems we fix on almost every site, and
the free way to fix each one.

Swipe

1

Too many scripts load at once

Analytics, chat widgets, sliders and pixels all fight for the phone's processor before the page can respond.

THE FIX

Delay JavaScript until the first scroll or tap

Scripts still run, just after the page is usable.

RESULT Total Blocking Time drops to near 0 ms

2

No page cache

WordPress rebuilds every page from the database for every single visitor.

THE FIX

Serve a ready-made HTML copy of each page

The page is sent before WordPress even loads.

RESULT Faster server response (TTFB)

3

Heavy images

Large JPGs and PNGs, all loading at once, with no width or height set.

THE FIX

WebP, lazy loading and image sizes

Smaller files, off-screen images wait, nothing jumps around.

RESULT Better LCP and CLS

4

Render-blocking CSS and fonts

The browser waits for every stylesheet and Google Font before it shows anything.

THE FIX

Remove unused CSS and host fonts locally

Each page gets only the CSS it uses. Text shows instantly.

RESULT Faster First Contentful Paint

5

Nobody checks the score

A new plugin or a big image quietly slows the site and nobody notices for months.

THE FIX

A weekly PageSpeed check on your dashboard

Mobile and desktop scores saved every week, with a trend.

RESULT Spot problems the same week

All 5 fixes. One plugin. Free.

- ✓ Delay JavaScript
- ✓ Page cache
- ✓ WebP and lazy loading
- ✓ Remove unused CSS, local fonts
- ✓ Weekly PageSpeed report
